

KANGA-ROBOT!

Meet **BionicKangaroo**, a bizarre hopping robot developed by German technology group **Festo**. Inspired by the way real-life 'roos store energy in their legs when they leap, the amazing *robo-roo* can recover energy when jumping, store it, and then re-use it to make the next jump. It's hoped the energy-efficient technology could be used in manufacturing industries, to help make cars or computers. Clever!
